Week Ending September 3, 1966

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

EPIDEMIOLOGIC NOTES AND REPORTS ENCEPHALITIS - Texas and Missauri

A total of 90 cases of clinical encephalitis with confirmatory or presumptive laboratory evidence and 45 suspect cases with inconclusive or pending data have been reported from Dallas through September 6, 1966. There have been 11 deaths. In addition, 25 cases of clinically diagnosed aseptic meningitis or febrile headache have presumptive laboratory evidence for St. Louis encephalitis virus infection. The criteria for the confirmed category is a fourfold increase in CF antibody titer, and for the presumptive, a CF or HI antibody titer of 1:10 or greater.

Corpus Christi for the same period has reported 48 laboratory confirmed or presumptive cases of encephalitis

and 28 suspect cases of clinical encephalitis with inconclusive or pending data. There have been two deaths.

Aerospraying with Malathion was completed in Dallas on August 27 and in Corpus Christi on August 29. It is still too soon to detect a definite reduction in the incidence of human disease related to this spraying operation.

CURRENT TRENDS MEASLES - 1966

A total of 178,559 cases of measles was reported in the United States during the first 26 weeks of 1966, 48,938 fewer than the total for the comparable period of 1965 and the lowest total in the preceding 10-year period (Figures 1 and 2). It is of interest that the progressive decline follows the availability of measles vaccine.

The Middle Atlantic, East North Central and East South Central Divisions, however, reported more cases of measles during the first half of 1966 than of 1965. New York City in the Middle Atlantic Region, Indiana, Illinois and Wisconsin in the East North Central Division, and Kentucky and Tennessee in the East South Central Division accounted for the majority of increases reported from their respective regions.

During the first 24 weeks of 1966, seven states reported 61.9 percent of the total measles cases, compared to 41.1 percent and 46.3 percent of the totals for the same periods in 1965 and 1964, respectively (Table 1). Approximately 51 percent of the total measles cases reported in the first 24 weeks of 1966 were concentrated in 70 out of 2,072 counties or health districts in 35 states, each of which recorded 500 or more cases. Only 23.2 percent of the population of the U.S. resides in these areas. Localized outbreaks of measles occurred in rural as well as urban areas, as the populations of the 70 counties or health districts range from 15,720 to over one million.

During the 10-year period 1955-64, there has been an average of 421 deaths per year, with a low of 364 in

1963 and a high of 552 in 1958. The West South Central, South Atlantic and East North Central Divisions had the highest ratios of deaths due to measles per 1,000 population between 1960 and 1964. Data on these deaths are not currently available concerning the frequency of the particular complications of measles leading to a fatal outcome. Measles Encephalitis

There were 128 cases of post-measles encephalitis reported for the first half of 1966, 58 more than during the comparable period of 1965 and 23 fewer than during the respective period in 1964 (Table 2). The ratio of reported cases of post-measles encephalitis to total cases in the U.S. was 0.7 per 1,000 cases the first half of 1966, a substantial increase over the 0.3 per 1,000 cases recorded for same periods in 1965 and 1964. An apparent increase in the relative frequency of encephalitis was seen in six of the nine Divisions.

Vaccine

From the time of measles vaccine licensure in 1963 through March 1966, approximately 15 million doses of live attenuated measles virus vaccine were distributed by manufacturers for use in the United States. The estimated number of susceptible children has been reduced from about 20 million to approximately 12 million.

Editorial Nate:

In 1965, when approximately six million doses of measles vaccine were distributed, most of the vaccine was used by physicians in private practice. As a result higher socioeconomic groups generally have been more adequately immunized than the lower socioeconomic

groups. Children in many rural areas have not been vaccinated against measles. Also, it has been the custom to concentrate on immunizing 1- and 2-year-olds while little emphasis has been placed on the protection of older children.

In October 1965, funds were made available for purchase of measles vaccine through the Immunization Assistance Act. The program provides measles vaccine free of charge for all preschool children. Geographical areas served by this program include 82 percent of the population of the U.S.

(Reported by the Childhood Viral Diseases Unit, Epidemiology Branch, CDC.)

EPIDEMIOLOGIC NOTES AND REPORTS ENCEPHALITIS - Texas and Missouri

(Continued from front page)

A total of five cases of clinical encephalitis with one death has been reported from St. Louis, Missouri. Two cases showed a fourfold increase in CF antibody titers for SLE. There have been no new cases since September 1, 1966.

(Reported by Dr. Van C. Tipton, State Epidemiologist, Texas State Department of Health; Dr. Hal J. Dewlett, Director, Dallas City Health Department; Dr. William R. Metzger, Director of Public Health and Welfare, Corpus Christi-Nueces County Health Department, Dr. E. A. Belden, Consultant, Communicable Disease Control, Missouri Department of Public Health and Welfare; Dr. C. Howe Eller, Commissioner of Health, St. Louis County, Missouri; and teams from CDC.)
